Quantum GIS
Quantum GIS (QGIS) is a user friendly Open Source Geographic Information System (GIS) that runs on Linux, Unix, Mac OSX, and Windows. QGIS supports vector, raster, and database formats. QGIS is licensed under the GNU General Public License. QGIS lets you browse and create map data on your computer. It supports many common spatial data formats (e.g. ESRI ShapeFile, geotiff). QGIS supports plugins to do things like display tracks from your GPS. QGIS is Open Source software and its free of cost (download here). We welcome contributions from our user community in the form of code contributions, bug fixes, bug reports, contributed documentation, advocacy and supporting other users on our mailing lists and forums. Financial contributions are also welcome.

Newsflash

Quantum GIS Version 0.11.0 has been released. It is available in source form, and as binary executables for Microsoft Windows, Mac OS X, and GNU/Linux. All versions can be obtained from our download page. If the version for your platform is not available please check back in a day or two as some packages are still being built.

QGIS 0.11.0 Released

Wednesday, 09 July 2008

Quantum GIS Version 0.11.0 has been released. It is available in source form, and as binary executables for Microsoft Windows, Mac OS X, and GNU/Linux. All versions can be obtained from our download page. If the version for your platform is not available please check back in a day or two as some packages are still being built.

QGIS 0.10.0 "Io" Release

Friday, 25 April 2008

Version 0.10.0 "Io" has been released and packages for major platforms are now available. For information on the release, see the Announcement on the QGIS Blog.

Migration to OSGeo Services

Thursday, 07 February 2008

We have embarked on the first step of the planned migration of services to OSGEO by migrating SVN, trac and the mailing lists to a new server (with many thanks to Howard Butler and Frank Warmerdam who facilitated the process).

This migration will have some impact on everyone using QGIS svn:

The 'old' server is still online but is now read only

Your existing checkouts will need to be 'switched'. To relocate your working copy to the osgeo-hosted repository:
o Change to the working directory
o svn switch --relocate https://svn.qgis.org/repos/qgis https://svn.osgeo.org/qgis

Your trac user account will need to be created. This is now (thankfully) a self help process - simply go to

https://www.osgeo.org/cgi-bin/ldap_create_user.py

and recreate your account. We suggest using the same login as previously used so that bug feedback and assignment will continue as normal.

** Note: ** if you already have an OSGEO user id there is no need to create a new one.

** Note: ** if you already have an OSGEO user id and it is different to your SVN committer user id, your write privileges will not work until you contact us with details of your QGIS id and your OSGEO id so we can reconcile them.

Trac is now available at:
o http://svn.qgis.org/trac (i.e. the original url should continue to work)
o https://trac.osgeo.org/qgis

The mailing list addresses have changed. All existing members have been migrated to the new lists. The addresses are:
o "qgis-developer": qgis-developer@lists.osgeo.org
o "qgis-user": qgis-user@lists.osgeo.org
o "qgis-doc": qgis-doc@lists.osgeo.org
o "qgis-commit": qgis-commit@lists.osgeo.org
o "qgis-trac": qgis-trac@lists.osgeo.org

After some consideration we decided not to keep the mailing list archives for qgis-commits and qgis-trac since this info is readily available in SVN and the trac web interface.

Over the coming weeks we will be working to migrate the http://qgis.org web site and wiki too. No doubt there will be some small hiccups as we carry out these changes. We will try to keep the disruptions to a minimum and trust that you will find the updated service offerings reliable and easier to use.

QGIS 0.9.1 Released

Sunday, 06 January 2008

OSGeo

Polls

I run QGIS on:
○ FreeBSD
○ Linux
○ Mac OS X
○ NetBSD
○ OpenBSD
○ Solaris
○ Windows
○ Other Unix
